

REQUIREMENT BRIEF – MODULE I

HR CHANGE MANAGEMENT & AUTOMATION SYSTEM

Background & Objective

The University proposes a centralized, web-based HR Change Management & Automation System to serve as the single source of truth for employee service-related changes. The system will eliminate duplicate data entry and ensure that every approved change is automatically reflected across connected HR records, organizational structures, reports, documents and employee files.

Structure:

- 1) There will be a Central Database of all Employees. This database shall be fully reflected in our ERP.
- 2) There will be an Organization Chart, which will be connected to this database and will update on changes in the database.
- 3) There will be various formats for change in Employees data, including the following:
 - a) Change in Salary
 - b) Change in Designation
 - c) Change in Reportee
 - d) Change in Reporting Authority
 - e) Change in Level
 - f) Change in Department/School
 - g) Change in Location
 - h) Additional responsibility added
 - i) Change in qualifications
 - j) Any other employee service condition related to the fields in the database

These changes should have the Level Approval Hierarchy:

- a) At HR Level
- b) At Senior Management Level

This should have a database change methodology, so that any change can come effective from the mentioned date. There will be an audit trail and version history.

Reports:

HR shall provide the lists and format of various reports which are required to be generated. There may be addition / deletion to these reports. Provision for generations of real-time reports should be there.
